
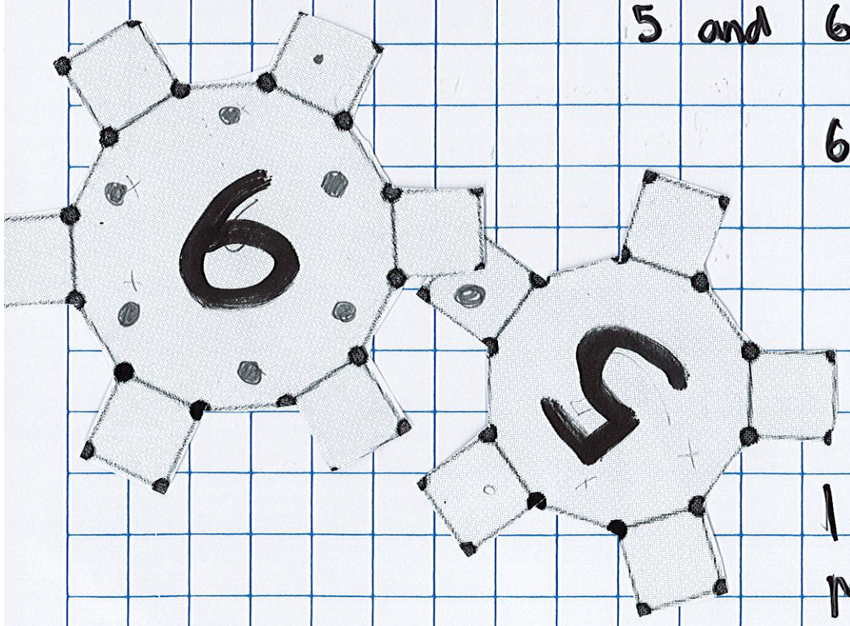
I notice that the space between the dots is the same number as the smaller cog. So I have to find a number that the dots will be next to each other.

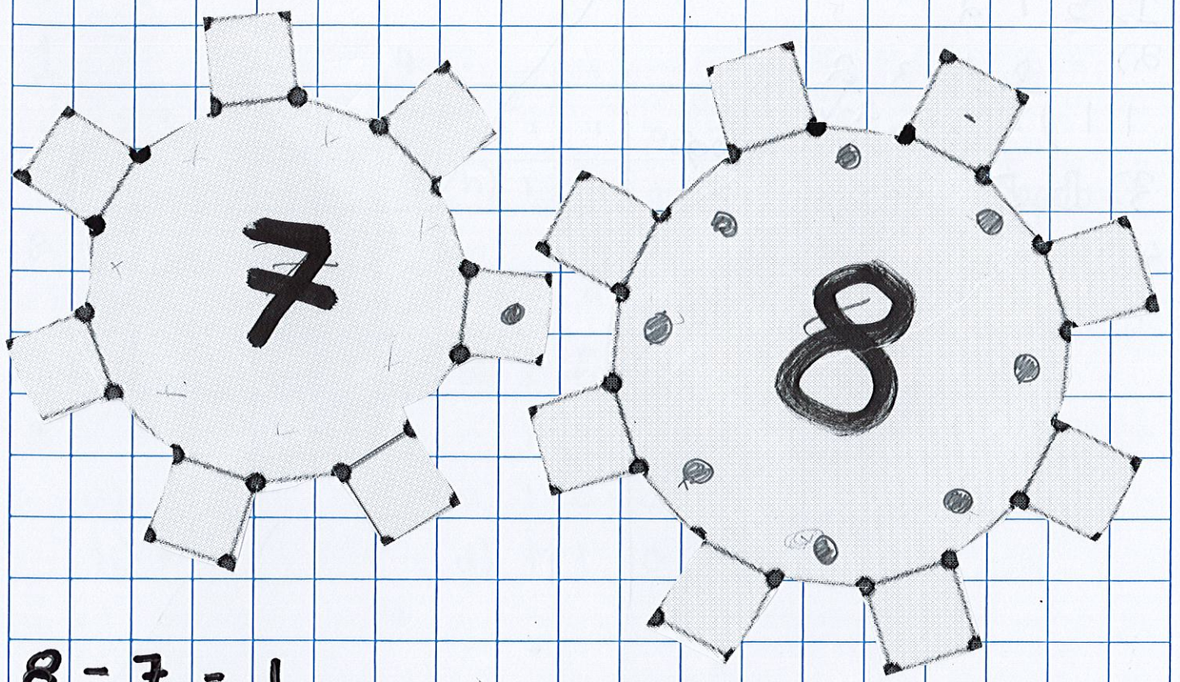
12 - 4 = 8 and every 8 spaces there is a dot.

12 and 4 don't work but 5 and 6 work.

I realised that 6 - 5 = 1, so the difference is one!



I start trying to prove this.



8 - 7 = 1

So I thought it would work.

And I was right.

I decided to test some numbers that I predicted that won't work. 11 - 9 = 2

I thought that 11 wasn't divisible by 2. But 10 is and the difference between 11 and ten is 1.

So it goes round a second time filling in the gaps.

But it did!
